

1     **ABSTRACT OF THE DISCLOSURE**

2             A decorative shade for a video display with a screen has a window  
3     with an opening to attach to the video display in front of the screen on the  
4     video display, a rolling device mounted inside the window and a blind  
5     wound on the rolling device to selectively cover the screen. Wherein, the  
6     window can be mounted detachably on the video display or formed integrally  
7     on the video display. The blind selectively winds onto or off the rolling  
8     device to open or cover the screen. When the blind covers the screen, the  
9     decorative shade protects and keeps dust off the video display. Furthermore,  
10    the window has a decorative appearance, and a picture on the blind imitates a  
11    piece of artwork. Thereby, the video display is changed into an artistic  
12    decoration.
